

Here's what has happened in the last month.

MONTHLY NEWSLETTER August Edition

In August, the Odyssey Educational Foundation was active in STEM activities, which included the Sensational Summer Take-Off program for students, providing web development and coding training for university interns. Additionally, the Foundation collaborated with the DroneHER aerial technology program for girls and advanced as a finalist in the international Mi-Hy MudTronics Championship with its TerraSense MFC project.

Recent Updates:

Events

These consist of all the events Odyssey educational foundation has had in the past month.

Volunteer/Intern Spotlight

This comprises of the highlight of the most hardworking staff and intern in the organisation. NOTE: this is monthly.

Stories of impact

We tell the stories that made the month more fun, and had impact on the students who attended the program.

Sensational Summer Take-Off Programme

Some summer programmes end with a certificate. This one ended with a partnership.

As the Sensational Summer Take-Off programme entered its concluding phase in August — with activities wrapping up in

the first week of September, it earned an endorsement that speaks for itself: Ibom Air has agreed to come on board for next year's edition. For a summer programme built on flight simulators, drones, and airport infrastructure, an airline choosing to back it isn't just validation — it's a sign the students were building something an industry recognised as real. It's easy to see why. Over the weeks, students didn't just learn about aviation and technology — they piloted drones, took the controls in flight simulators, and wired microcontroller-powered traffic and airport runway lights from scratch.

In the workshop, robotics met craftsmanship: participants picked up woodworking tools and safety techniques to build the physical frames housing their own electronics, turning circuit boards into finished, functioning builds.

Coding and AR/VR ran through every stage, giving students a technology experience as broad as it was hands-on.

None of it would have landed the way it did without the environment behind it. Facilitators kept the space approachable and supportive — one where questions were welcomed, complex ideas were explored freely, and confidence was built alongside knowledge.

The result was a programme good enough to make an airline want in. Next year's Take-Off is already shaping up to fly higher.

DroneHER Programme

This program, organised by the Society of Women Engineers (SWE), in collaboration with Odyssey Educational Foundation, ran from 17 July to 19 August 2026, introduced 50 girls to drone technology,

Participants received foundational and practical training in drone components, flight principles, safe operation, navigation and control. They also explored STEM careers, engaged in team challenges, and competed in Drone Soccer. An important element of the programme was awareness of SWE's global community and support for women in engineering. The final showcase featured guest speakers from the aviation and engineering sectors, including representatives of the Permanent Secretary of Aviation and Aerospace and the President of APWEN.

100 percent of respondents reported learning a great deal about drones, 100 percent had the opportunity to control a drone, and 100 percent expressed interest in further drone, robotics, or STEM activities

Mi-Hy MudTronics Competition

Odyssey actively participated in and competed in the Mi-Hy MudTronics Championship, a global and collaborative competition that is spearheaded by the Mi-Hy research project.

The initiative challenges makers, scientists, artists, and technologists worldwide to push the boundaries of bio-electrochemical system design by converting organic waste, mud, wastewater, and naturally occurring microbes into usable electrical energy via Microbial Fuel Cells (MFCs). Competing alongside 37 innovative teams representing 21 countries across the globe, Odyssey's technical team designed and developed the TerraSense MFC. The TerraSense system utilizes local materials, carbon-based electrodes to generate low-voltage power

Overcoming the challenges of getting project materials, the team successfully advanced through the competitive preliminary evaluation rounds and have advanced to the final stage of the competition.

Pi Foundations Programme

On 29th August 2026, six young minds walked into "Mastering the Basics of Raspberry Pi", and walked out having built something real. This was hands-on from the first minute: participants unpacked the Raspberry Pi family of single-board computers, decoded GPIO pins, and connected the dots between IoT theory and the

Components that make it work. Then came the centrepiece — wiring a temperature and humidity sensor directly to a Raspberry Pi and watching live readings appear on screen, built with their own hands.

By the end of the session, six participants had gone from "what's a Raspberry Pi?" or "I've seen this before, but what can I use it to build?" to building functioning IoT circuits. And this is proof that the right hands-on approach turns curiosity into capability in a single afternoon.

This month's version of the Raspberry Pi program was an effective one, and this is what access to hardware looks like when it's done right. And it's exactly the kind of moment that partnerships and sponsorships makes possible.

MATTHAIS ILIYA ZAKKA

Matthias's journey with Odyssey Educational Foundation started over a year ago as an intern, and it's since grown into something much bigger. In that time, he's built a strong foundation in animation, game design, Scratch-based storytelling, virtual interactive projects, and core programming concepts, sharpening his craft with every project.

Now, he's turned that growth into giving back. As a volunteer teacher in Odyssey's summer class, Matthias leads students through coding and project development, breaking down technical concepts and guiding them toward real computational thinking—not just following instructions, but learning to think like builders.

"Odyssey gave me the platform to learn, to grow, and now to teach," Matthias says. It's a full-circle moment: the student who once sat where his students now sit.

MATTHAIS ILIYA ZAKKA

We are honoured to spotlight Matthias because he built the already implemented digital attendance system for the organisation.

Well-done Matthias! We're happy to have you on our team, and we're excited for your journey with us.

EMMANUELLA OLUFIADE

For Emmanuella, building "Lumina" was a story of bugs and breakthroughs. She and her team, The Pantheons, set out to solve a pressing issue in their community but before they could write a single line of code, they had to agree on who they were. It took several attempts before the name "The Pantheons" finally stuck.

That was only the beginning. As the project progressed, the team faced misunderstandings, internal conflicts, and technical setbacks that tested their resolve. But they didn't back down. Technovation taught them patience and teamwork, especially when collaboration grew difficult.

Midway through the program, Emmanuella went quiet for a stretch; she was sitting for her SSCE exams. But her absence from the team wasn't a setback; it set the stage for one of their biggest triumphs. When she returned, she and her teammates pushed through complex technical challenges to bring their mobile app to life.

EMMANUELLA OLUFIADE

Emmanuella didn't just walk away with an app. Technovation sparked deeper exploration, inspiration, and curiosity in her, and her experience with Technovation Girls remains one she calls unforgettable.

Her discipline paid off beyond the program, too: Emmanuella sat her SSCE while still in SS2 and came out with 7 A's and 2 B's.

Her story is giving bugs to breakthroughs. This is the impact we make and the stories we love.

1. Student Venture Capital Grant (S-VCG) Prize (up to N50m + mentorship)

<https://svcg.education.gov.ng/>

August, 2026

Odyssey Educational Foundation is committed to impacting society positively through STEM education. We are involved in a wide range of areas in education, and they include capacity building for educators, development of STEM programs and their implementation, women's empowerment, gender equality, and quality education for the girl child.

Our focus is on how to bridge the gap in STEM literacy in Nigeria, moving the nation from "labor-driven to knowledge-driven.

Our Mission

To promote STEM education & application with a view to catalysing industrialisation, Research and Development, and co-creating with nature in the African region.

Our Vision

A future without skill-gap, ensuring inclusiveness in human development and participation to attain excellence.
